## **CoolGlide® Laser Hair Removal**

### **What areas can be treated?**

- All parts of the body may be treated including face, arms, underarms, legs and back. Sensitive areas like the chest and bikini may also be treated.

### **Number of treatments required:**

- Most areas require 6-8 treatments, however, the number of treatments for optimal results depend on multiple factors: hair thickness, texture, and the area being treated. In some areas, in addition to the decrease in the number of hairs, the hairs become very fine and light in color.
- Expect to need more treatments if you have any history of irregular periods, polycystic ovary disease, or a family history of excessive hair.
- No laser clinic should claim that all of the hairs will be permanently eradicated. Most patients will need a touch-up 1-4 times a year to maintain the improvement.
- About 5% of patients are resistant to any type of hair removal laser. It is very important to have a realistic expectation regarding individual results of laser hair removal.

### **Treatment intervals:**

Laser hair removal should be performed at 4 to 8 week intervals to correspond to the natural growth cycles of the hair follicle. Decreasing the interval of treatment will not effectively alter the permanency of the hair growth.

- 4-6 week intervals: face & neck.
- 6-8 week intervals: bikini, underarms, back, arms, & legs.

Effect. 12/01/2010

### **Pre-Treatment:**

- **NO** bleaching, tweezing, or waxing 2 weeks before the treatment and throughout the duration of the treatments. The areas must be shaved prior to each treatment. A \$50 shaving prep fee will apply to all who come unshaved.
- **Do not tan.** Tanning of any type changes the laser settings and is the most common cause of blistering after laser hair removal. Do not use self-tanners one to two weeks before a treatment.
- All makeup and lotion should be removed prior to treatment.
- If antibiotics or any new medications have been started, inform your provider prior to treatment.

### **Post-Treatment:**

- Redness—may feel like a sunburn and last a couple hours after treatment.
- Swelling—may last up to 2-3 days.
- Blistering—rare
- Shedding of the surface hair may occur anywhere between 7-21 days post treatment (this may look like re-growth when actually the hairs are being shed).
